- Customers

Course Overview

The Datacom™ Systems REST API 2.0 provides read-only endpoints to the Datacom™ System-Level status and configuration info (DIR_ and MUF_Datacom System Tables). It is on the Java platform, so the rest API can run on any system that has the CVM installed, like USS or Windows systems.

Datacom™ Systems REST API is built using the Broadcom Business API Generator. It also provides an additional "view" endpoint for the Health Check Analyzer, and modern monitoring applications can be built using the REST API.

Note: If you'd like to share your ideas for Broadcom Mainframe product training, subscribe to the [Mainframe Education Community](#), where we'll share calls for input.
