- [CA 7 Web-Based and Instructor-Led Training](#)
- [ESP Workload Automation Web-Based and Instructor-Led Training](#)

Course Overview

Workload Automation Agent Manager offers a centralized solution for monitoring and maintaining workload automation system agents within your cross-platform scheduling ecosystem. This efficient tool streamlines common tasks that span various platforms and often involve multiple teams. Now, you can manage these tasks conveniently from a single interface, all while maintaining robust security control through z/OS security policies. This capability dramatically reduces the time, effort, and platform-specific expertise previously required for routine system agent administration and upgrades. In addition, it helps eliminate cross-role, department, and business unit dependencies. Agent Manager is available for both the CA 7™ Workload Automation Intelligence solution and the ESP Workload Automation Intelligence solution.

This course is designed to introduce the capabilities of the Workload Automation Agent Manager, and demonstrates how to complete tasks that can be performed by Operators and Administrators. More information about Administrator-specific tasks is provided in the CA 7 and ESP Workload Automation product documentation.

This Course Will Show You How To:

- Describe the tasks that Operators and Administrators can complete using the Workload Automation Agent Manager
- Use the Workload Automation Agent Manager to view agent details, retrieve agent log files, and export a list of monitored agents
